

Travel Simulation Recommendation

Proposed location:

Latitude: 51.5581234

Longitude: -0.0307055

Selected line: Central

Coverage context:

The proposed location appears to have weak rail coverage. There are only 0 existing stations within the catchment, and the nearest station is Leyton Underground Station, approximately 1754.6m away. This suggests the proposal may address an accessibility gap, especially if land-use patterns indicate nearby residential, commercial or employment activity.

Land-use breakdown:

- Grass: 74.81%
- Trees: 25.09%
- Built-up: 0.1%

Land-use context:

The catchment is dominated by green/open land, with 99.9% made up of trees, grass or shrubland. This may explain weaker coverage or lower station priority, unless the area includes major parks, attractions, housing edges or employment sites.

Recommendation:

The proposed station should be prioritised for further feasibility analysis. The area appears to have weak existing coverage, and if demand analysis supports this, the proposal may address a meaningful accessibility gap.

Assumptions and limitations:

- Coverage level is currently based on the number of existing stations within a 400m catchment.
- Land-use data is based on broad satellite classification from Google Earth Engine Dynamic World.
- Built-up land does not distinguish perfectly between residential, commercial and industrial use.
- This report should be updated once simulation demand impact results are available.
